

CRACK SEALING

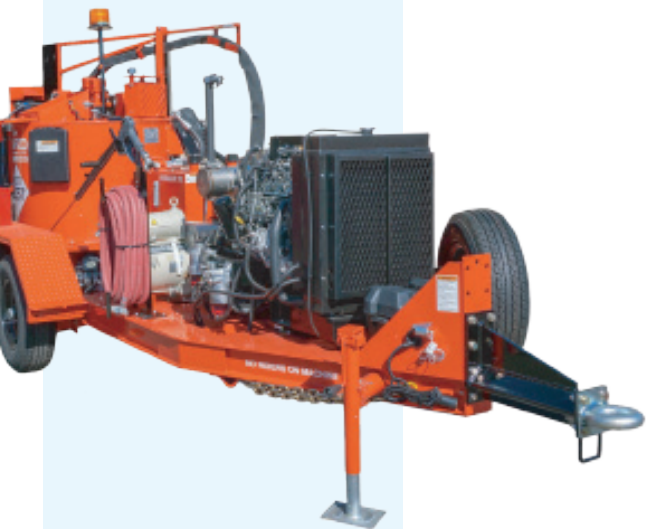

CRACK SEALING OFFERS LONG LASTING PROTECTION

Asphalt left unprotected against the weather elements not to mention cars and trucks will cause deterioration, resulting in the life of your roads and parking lots being seriously shortened. Over time this will lead to even more expensive solutions such as excavation and re-pavement.

Crack filling and sealcoating is the best value in preserving your existing asphalt. It is also your lowest cost, highest benefit preservation treatment. Without crack sealing, 75% of cracks form into potholes in less than three years. With crack sealing, only 1% of sealed cracks develop into potholes in the same time frame.

Crack sealing is the best surface treatment to:

- Extend the service life of pavement.
- Maximize your road's service life and get the highest benefit with the lowest cost. To be effective, crack sealing should be performed early and often. This will delay the need for more significant and expensive pavement treatments.
- Fewer potholes result in less pothole patching and related expenses such as significantly re-routing traffic, paying for broken tires and even helping to prevent accidents.
- Crack sealing is a great solution not only for local municipalities but for retail businesses as well.
